# BLS / ILS / ALS Standing Medical Orders

**REVISED: March 1<sup>st</sup>, 2022** Effective: May 1<sup>st</sup>, 1998

# REGION 7 EMERGENCY MEDICAL SERVICES SYSTEMS BLS / ILS / ALS STANDING MEDICAL ORDERS

These orders are to be used as the prehospital treatment protocols. They are to be followed by all Basic Life Support (BLS), Intermediate Life Support (ILS), and Advanced Life Support (ALS) members of the EMS System. We have incorporated evidence-based guidelines with historically proven practices to produce them. While it is impossible to address every possible variation of disease or traumatic injury, these protocols do provide a foundation for treating the vast majority of patients we encounter. Certainly our education, experience, and clinical judgment will assist us as we strive to provide the highest quality prehospital patient care. Deviations from these orders can be made only by the EMS Medical Director or designee.

These orders are to be used in the following situations:

- When the initiation of care begins before hospital communication is established.
- In the event that communications cannot be established or communication is disrupted or lost between the responding paramedics and their directing hospital. Every effort should be made to contact the hospital over the telemetry radio, MERCI radio, cellular phone or landline phone.
- Until the patient arrives at the hospital and the patient's care has been transferred to the appropriate hospital personnel.
- In disaster situations, when immediate action to preserve lives and limbs supersedes the need to communicate directly with the hospital.

Due to geographic and regional considerations, some systems may include or exclude certain drugs as indicated.

#### GENERAL

# **Protocol 1**

### INITIAL MEDICAL CARE / ROUTINE CARDIAC CARE GENERAL PATIENT ASSESSMENT

- Prehospital providers shall always assess the scene to assure the safety of all personnel.
- Patient care and treatment begins at the "bedside."
- Prehospital personnel shall take all reasonable precautions to prevent exposure to blood and/or body fluids of any patient. Use fluid repellent gowns, masks and goggles as situation dictates.
- For pediatric dosing, utilize a length based Pediatric Tape or Chart

#### **GENERAL PATIENT ASSESSMENT**

#### Initial Assessment:

- 1. Circulation (pulse) and hemorrhage control (if indicated)
- 2. Airway Establish and/or maintain an airway (cervical spine control, if indicated)
- 3. Breathing Assist ventilation as required
- 4. Disability (Level of Consciousness)
  - "Alert"
  - "Verbal" (responds to verbal stimuli)
  - "Pain" (responds to painful stimuli)
  - "Unresponsive"
- 5. Expose and examine (if indicated)

#### Focused Assessment:

- 1. Vital signs, and where applicable, GCS parameters
- 2 Systematic head-to-toe detailed assessment
- 3. History of present illness/injury
- 4. Advanced Directives, if available
- 5. Medication List, if available

#### INITIAL MEDICAL CARE/ROUTINE CARDIAC CARE

- 1. Reassure patient, provide comfort and loosen tight clothing.
- 2. Sit patient in semi-Fowler's or position of comfort (if applicable).
- 3. Obtain Pulse Oximeter value prior to oxygen delivery. Deliver **OXYGEN** 2-6L by nasal cannula or 12-15L by mask, if appropriate, unless otherwise specified.
- 4. Evaluate cardiac rhythm, if indicated. Consider use of 12-lead (if available). All ALS patients do not necessarily require continuous ECG monitoring or transmission of a strip to the hospital.
- 5. I If patient's condition warrants, obtain IV access (Saline lock or NS). Attempt x2 unless requested to continue.
- For adult and pediatrics ≥ 4 years old experiencing nausea, consider Zofran 4mg ODT/IV x1 dose.
  BLS: For adult and pediatrics ≥ 4 years old experiencing nausea, consider Zofran 4mg ODT x1 dose.
- Contact hospital as soon as patient's condition permits. Transmit assessment information and await orders. If no radio contact can be established or patient's condition requires immediate treatment, refer to appropriate protocol ♦ and begin intervention immediately.
- 8. Recheck vitals and other pertinent signs at least every 15 minutes and record, note the times.
- 9. Transport to closest hospital. NOTE: By law, a physician must certify that the benefits outweigh the risk of transport to a facility other than the nearest hospital. If the patient refuses care or transport to the closest hospital, refer to policy and document signatures and situation.

NOTE: In a combative or uncooperative patient, the requirement to initiate initial routine medical care, as written, may be altered or waived in favor of rapidly transporting the patient for definitive care. Document the patient's actions or behaviors which interfered with the performance of any assessments and/or interventions.

GENERAL

# **Protocol 2**

### RADIO REPORT AND ABBREVIATED RADIO REPORT

#### OUTLINE FOR RADIO REPORT (Transmit using as few words as possible)

- 1. Name and vehicle number of provider
- 2. Requested destination, closest hospital and estimated time of arrival
- 3. Age, sex, and approximate weight of patient
- 4. Chief Complaint, to include symptoms and degree of distress
- 5. History of present illness/injury
- 6. Pertinent Medical History:
  - Allergies
  - Medications
  - Past History of current illness
  - Last Meal
  - Events surrounding incident
- 7. Clinical condition:
  - Focused and detailed patient assessment findings
- 8. Treatment initiated and response

The use of an abbreviated report is optional. A full report may always be given at the discretion of the prehospital provider. A full report must always be given:

- when vital signs are unstable,
- when any treatment has been initiated other than OXYGEN and/or IV, or
- when requesting transport to destination other than the closest hospital (by time).

# Refer to and follow the steps under **GENERAL PATIENT ASSESSMENT** and **INITIAL MEDICAL CARE** / **ROUTINE CARDIAC CARE PROTOCOL #1.**

#### OUTLINE FOR ABBREVIATED RADIO REPORT (Transmit using as few words as possible)

- 1. Name and vehicle number of provider
- 2. Requested destination, closest hospital, and estimated time of arrival
- 3. Age and sex
- 4. Chief Complaint, to include symptoms and degree of distress
- 5. Clinical condition:
  - Vital signs stable

NOTE: When contacting the receiving hospital with a CODE STEMI or CODE STROKE it is acceptable to use an abbreviated radio format announcing CODE STEMI or CODE STROKE when the patient's condition and attention warrants.

Medical Control

#### Policy:

Unsuccessful cardiopulmonary resuscitation (CPR) and other ALS interventions may be discontinued prior to transport or arrival at the hospital when this procedure is followed.

#### Purpose:

The purpose of this policy is to allow for discontinuation of prehospital resuscitation after the delivery of adequate and appropriate ALS therapy.

#### Procedure:

Following an assessment by an ILS/ALS provider <u>AND</u> consultation with <u>Medical Control Physician</u>, resuscitation MAY BE stopped under the following circumstances:

- The physical environment becomes unsafe for EMS providers.
- The exhaustion of EMS providers.
- If after 3 rounds of 2 minutes of CPR the patient's measured ETCO<sub>2</sub> (if available) (via supraglottic airway or ETT) remains below 6mmHg.
- The AED advises "no shock" on 5 sequential analyses during resuscitation and ALS/hospital care is not available within 20 minutes (hypothermia is an exception).
- Extrication is prolonged (>15 minutes) in a pulseless, apneic patient, with no resuscitation possible during extrication (hypothermia is an exception).
- There is no return of spontaneous circulation or shockable rhythm after 20 minutes of ALS interventions.
- Patient has a valid DNR where resuscitation efforts were initiated prior to knowledge of resuscitation status.
- Full ACLS has been instituted (ILS/ALS) to include rhythm analysis and defibrillation if indicated, appropriate airway management, and three rounds of the appropriate ACLS medications are given without return of spontaneous circulation.
- · Correctable causes or special resuscitation circumstances have been considered and addressed.
- If directed to do so by Medical Control Physician.
- Prolonged resuscitation efforts beyond 20 minutes without a return of spontaneous circulation may be futile, unless cardiac arrest is compounded by hypothermia, submersion in cold water, or refractory ventricular fibrillation or ventricular tachycardia.

Note: If the above criteria are not met and discontinuation of prehospital resuscitation is desired, contact **Medical Control Physician**. Resuscitation efforts will be continued until orders for termination of resuscitation have been received by **Medical Control Physician**.

Document all elements of patient care and interactions with the patient's family, personal physician, medical examiner, law enforcement and **Medical Control Physician** in the EMS patient care report (PCR).

### **Protocol 10**

# ADULT CARDIOGENIC SHOCK

#### NOTE TO PREHOSPITAL PROVIDERS:

If patient is in or develops respiratory distress despite treatment, maintain airway and prepare to intubate.

#### AT DISCRETION OF MEDICAL CONTROL:

For prolonged geographical transport consider PUSH DOSE EPINEPHRINE: Label the syringe as PUSH DOSE EPINEPHRINE (100mcg/10ml).

#### Mixing Instructions:

Take a 10ml syringe with 9ml of normal saline. Into this syringe, draw up 1 ml of **EPINEPHRINE** (1mg/10ml) from the cardiac amp.

Administer 0.5ml IV/IO every 2 minutes to maintain SBP > 90 and HR > 60

For a pediatric patient refer to **PEDIATRIC SHOCK PROTOCOL #68** 

Revised: 03/01/22 Effective: 05/01/98

# **Protocol 11**

### ADULT VENTRICULAR FIBRILLATION / PULSELESS VENTRICULAR TACHYCARDIA

For a pediatric patient refer to PEDIATRIC TACHYCARDIA PROTOCOLS #64 / #65 🔷

Revised: 03/01/22 Effective: 05/01/98

# **Protocol 12**

# ADULT TACHYCARDIAS (WITH PULSE)

#### NOTE TO PREHOSPITAL PROVIDERS:

Ρ

- 1. \*Signs of hypoperfusion: severe CP, severe SOB, SBP < 90, diaphoresis, altered mental status.
- 2. **ADENOSINE (Adenocard)** should always be administered RAPID IV and immediately followed with a **20ml NS bolus**. Antecubital vein is preferred site to administer **ADENOSINE (Adenocard)**.
- 3. Always record rhythm strip and deliver to physician caring for patient.
- Wide Complex = QRS > 0.12 sec. (3 small boxes) Narrow Complex = QRS < 0.12 sec.</li>
  - 5. Sinus Tachycardia should be treated appropriately.
- 6. If **MIDAZOLAM HYDROCHLORIDE (Versed)** is administered for sedation, monitor via pulse oximetry and capnography (if available).
- 7. \*\*Do not delay synchronous cardioversion while awaiting IV access.

For a pediatric patient refer to PEDIATRIC TACHYCARDIA PROTOCOLS #64 / #65 🔷

Revised: 03/01/22 Effective: 05/01/98

В

Т

# **Protocol 14**

# ADULT PULSELESS ELECTRICAL ACTIVITY (PEA) /ASYSTOLE

# **Protocol 15**

# ADULT BRADYCARDIA (PULSE < 60)

#### NOTE TO PREHOSPITAL PROVIDERS:

- 1. \*Signs of hypoperfusion include: severe chest pain, severe SOB, SBP <90, diaphoresis.
- 2. If Transcutaneous Pacer not available, Medical Control may order PUSH DOSE EPINEPHRINE.
- **3.** \*\*Do not delay Transcutaneous Pacer while awaiting IV access OR for **ATROPINE** to take effect if patient is symptomatic.
- 4. If **MIDAZOLAM HYDROCHLORIDE** (Versed) is administered for sedation, monitor via pulse oximetry and capnography (if available).

#### AT DISCRETION OF MEDICAL CONTROL:

For prolonged geographical transport consider PUSH DOSE EPINEPHRINE: Label the syringe as PUSH DOSE EPINEPHRINE (100mcg/10ml)

Mixing Instructions:

Take a 10ml syringe with 9ml of normal saline. Into this syringe, draw up 1 ml of **EPINEPHRINE** (1mg/10ml) from the cardiac amp.

Administer 0.5ml IV/IO every 2 minutes to maintain SBP > 90 and HR > 60

For a pediatric patient refer to PEDIATRIC BRADYCARDIA PROTOCOL #63

Revised: 03/01/22 Effective: 05/01/98

# **Protocol 16**

# ADULT SUSPECTED CARDIAC PATIENT

#### NOTE TO PREHOSPITAL PROVIDERS:

- 1. If adverse response to MORPHINE SULFATE consider NALOXONE (Narcan).
- 2. For prolonged geographical transport, consider Right-side 12-Lead (if available).
- \*Contraindications to ASPIRIN would include ASPIRIN allergy, pregnancy, and history of gastrointestinal bleeding.
- 4. \*\* Contact Medical Control prior to administration of NITRATES if patient is taking erectile dysfunction medications (i.e. Viagra, Levietra, Cialis, etc.).

### **Protocol 17**

### ADULT PULMONARY EDEMA DUE TO HEART FAILURE

#### NOTE TO PREHOSPITAL PROVIDERS:

\*Contact **Medical Control** prior to administration of **NITRATES** if patient is taking erectile dysfunction medications (i.e. Viagra, Levitra, Cialis, etc.).

# **Protocol 18**

# VENTRICULAR ASSIST DEVICES (VAD/LVAD)

#### NOTE TO PREHOSPITAL PROVIDERS: If defibrillation or cardioversion is indicated, place defibrillator pads away from LVAD and AICD/Pacemaker

### **Protocol 19**

FIELD TRIAGE PROTOCOLS

- Transport directly to the nearest Level I Trauma Center if transport time is less than 25 minutes.
- Transport to the nearest Level II Trauma Center if transport time is less than 30 minutes.
- Transport to the nearest Emergency Department if transport time is greater than 30 minutes

#### FIELD TRIAGE CATEGORY I

Sustained hypotension -  $B/P \le 90$  systolic on two consecutive measurements five minutes apart. (For Peds hypotension see Peds VS below +)

Cavity penetration of the torso or neck

□ MANDATORY NOTIFICATION OF THE TRAUMA SURGEON FROM THE FIELD (done by the Trauma Center).

D PATIENTS BEING BYPASSED TO A TRAUMA CENTER MUST BE ADEQUATELY VENTILATED (ET TUBE OR BVM) AND HAVE CERVICAL IMMOBILIZATION AS INDICATED. OTHERWISE, THE PATIENT SHOULD BE TRANSPORTED TO THE CLOSEST COMPREHENSIVE EMERGENCY DEPARTMENT.

- Blunt or penetrating trauma with unstable vital signs and/or:
- Hemodynamic compromise as evidenced by: Adult B/P: ≤ 90 systolic
- Peds: 0 5 mos of age: Sys BP < 60 mmHg</p>

6 mos – 5 yrs: > 6 yrs: Sys BP < 70 mmHg, HR < 70 Sys BP < 80 mmHg, HR < 60

- Respiratory compromise as evidenced by: respiratory rate <10 OR >29
- Head injury with altered mentation as evidenced by a GCS ≤ 10.

#### Anatomical Injury:

- Penetrating injury of the head, neck, chest or abdomen.
- · Two or more body regions with potential life or limb threat.
- Combination trauma with  $\geq$  20%TBSA burn.
- Amputation above the wrist or ankle.
- Limb paralysis and/or sensory deficit above the wrist or ankle.
- · Flail chest.
- Two or more proximal long bone fractures.

All patients who, in the judgment of the prehospital personnel, would benefit from the care derived at a Trauma Center- those conditions which <u>may be considered</u> for direct bypass to a Trauma Center <u>may</u> include:

- Head Injury with persistent unconsciousness or focal signs such as seizures, posturing or the inability to respond to simple commands.
- · Transmediastinal gunshot wounds
- Spinal cord injury with paralysis
- Maternal trauma with significant mechanism and/or obvious trauma at 20-32 weeks gestation.
- Pediatric trauma including blunt or penetrating head, chest or abdominal trauma.
- Older Adults: Risk of injury/death increases after age 55, SBP <110 may represent shock after age 65, Low impact mechanisms (e.g. ground level falls) may result in severe injury
- Anticoagulants and bleeding disorders: Patients with head injury are at a high risk for rapid deterioration

#### CATEGORY II

Mechanism of Injury:

- Ejection from a motor vehicle.
- Death in the same passenger compartment.
- Falls > 20 feet.
- Falls >three times the body length of a child.
- Maternal trauma > 20 weeks.

В	EMT	В
Ι	EMT-I	Ι
Ρ	Paramedic	Ρ

# **Protocol 20**

# **REVISED TRAUMA SCORE/GLASGOW COMA SCALE**

A standard procedure for assessing revised trauma scores in the field is necessary so that the reliability of that revised trauma score is recognized by both field personnel and emergency department personnel.

The patient is scored by assessing the following vital functions and computing a score - the **REVISED TRAUMA SCORE**.

В	EMT	В
I	EMT-I	T
Ρ	Paramedic	Ρ
Μ	Medical Control	Μ

- 1. Respiratory rate
- 2. Systolic blood pressure
- 3. Glasgow coma scale

### For the Glasgow Coma Scale, the examiner determines the best response the patient can make to a set of standardized stimuli.

- 1. Eye opening: The examiner determines the minimum stimulus that evokes opening of one or both eyes.
  - a. (4 points) SPONTANEOUS
  - b. (3 points) VOICE
  - c. (2 points) PRESSURE
  - d. (1 point) NONE

Note: If the patient cannot open the eyes because of bandages, edema or direct trauma, please note and document in the patient's record.

- 2. Best Verbal Response: The examiner determines the BEST response after arousal:
  - a. (5 points) ORIENTED
  - b. (4 points) CONFUSED
  - c. (3 points) INAPPROPRIATE WORDS
  - d. (2 points) INCOMPREHENSIBLE SOUNDS
  - e. (1 point) NO VERBAL RESPONSE

Note: If the patient is intubated, dysphasic or has maxillofacial injuries which may preclude a verbal response, the examiners assessment should be documented in the patient's record.

- 3. Best Motor Response: The examiner determines the BEST movement from either arm in response to stimulus.
  - a. (6 points) OBEYS SIMPLE COMMANDS
  - b. (5 points) LOCALIZES PRESSURE
  - c. (4 points) FLEXION WITHDRAWAL
  - d. (3 points) ABNORMAL FLEXION
  - e. (2 points) ABNORMAL EXTENSION
  - f. (1 point) NO MOTOR RESPONSE

Note: If the patient has suspected or known spinal cord injury, this neurologic deficit should be noted in the patient's record.

The components necessary to calculate the Revised Trauma Score and Glasgow Coma Scale will be obtained by prehospital personnel. The actual calculation of these scores will be performed by **Medical Control**. These scores are to be obtained when the need for transport to a trauma center is questionable.

### **Protocol 21**

# ROUTINE TRAUMA CARE PAGE 1 OF 2

- 1. Prehospital providers shall always assess the scene to assure the safety of all personnel.
- 2. Patient care and treatment begins at the scene.
- Prehospital personnel shall take all reasonable precautions to prevent exposure to blood and/or body fluids of any patient. Use fluid repellent gloves, gowns, masks and goggles, as situation dictates.

#### PRIMARY PATIENT ASSESSMENT

- 1. ESTABLISH LEVEL OF RESPONSIVENESS
  - Brief history: Any dyspnea or pain?
- 2. IMMOBILIZE C-SPINE
  - Manual immobilization initially
  - Rigid collar, Cervical Immobilization Device, and spinal motion restriction as indicated prior to transport (Refer to SPINE INJURY PROTOCOL #23)
- 3. CIRCULATION (Refer to the ADULT HEMORRHAGIC SHOCK PROTOCOL #22 or the PEDIATRIC SHOCK PROTOCOL # 68)
  - Life threatening hemorrhage STOP THE BLEEDING.

For uncontrolled hemorrhage, use a tourniquet when needed or consider a hemostatic dressing (if available).

- Peripheral pulses (weak, thready, absent)
- Capillary refill (if delayed)
- 4. CHECK THE NECK
  - Carotid pulses

If absent: CPR, minimize scene time (Refer to TRAUMATIC CARDIOPULMONARY ARREST PROTOCOL #25)

- Tracheal deviation (Refer to CHEST TRAUMA PROTOCOL #31)
- JVD (Refer to CHEST TRAUMA PROTOCOL #31)
- 5. AIRWAY (If obstructed Refer to AIRWAY OBSTRUCTION PROTOCOL #4)
  - Open or secure as needed
- 6. BREATHING (Refer to CHEST TRAUMA PROTOCOL #31 � and either the ADULT RESPIRATORY DISTRESS PROTOCOL #3 or the PEDIATRIC RESPIRATORY DISTRESS PROTOCOL # 66) �
  - ASSIST VENTILATION AS REQUIRED
  - Inspect the chest
  - Palpate the chest
  - Auscultate the chest (including the heart)
- 7. NEUROLOGIC DEFICIT (Refer to HEAD TRAUMA / UNCONSCIOUS PATIENT PROTOCOL #24)
  - AVPU
  - Motor & Sensory
  - Pupils

E	3	EMT	В
I	I	EMT-I	Ι
ł	D	Paramedic	Ρ

# **Protocol 21**

# ROUTINE TRAUMA CARE PAGE 2 OF 2

SECONDARY PATIENT ASSESSMENT

- 1. Vital Signs
- 2. GCS scoring parameters
- 3. Systematic head to toe assessment
- 4. Medications
- 5. Allergies
- 6. Reassure patient, provide comfort, loosen tight clothing, and keep patient warm.
- 7. Evaluate cardiac rhythm, if indicated. (All ALS patients do not necessarily require continuous ECG monitoring or transmission of a strip to the hospital.)
- 8. Contact hospital as soon as patient's condition permits. Transmit assessment information and await orders.

If no radio contact can be established or patient's condition requires immediate treatment, refer to appropriate protocol  $\diamondsuit$  and begin intervention immediately.

9. Recheck vitals and other pertinent signs and symptoms at least every 15 minutes and record, noting times.

If unstable vital signs/sustained hypotension (SBP <90 on two separate readings 5 minutes apart), vital signs should be taken and recorded every 5 minutes.

10. All patients, who, in the judgment of prehospital personnel, would benefit from care derived from a Trauma Center, should be transported accordingly (Refer to **FIELD TRIAGE PROTOCOLS #19**).

If unable to ventilate, transport to nearest hospital.

#### NOTE TO PREHOSPITAL PROVIDERS:

In a combative or uncooperative patient, the requirement to initiate initial routine trauma care, as written, may be altered or waived in favor of rapidly transporting the patient for definitive care. Document the patient's actions or behaviors which interfered with the performance of any assessments and/or interventions.

OUTLINE FOR RADIO REPORT (Transmit using as few words as possible)

- 1. Name and vehicle number of provider
- 2. Requested destination, closest hospital, and estimated time of arrival
- 3. Age, sex, and approximate weight of patient
- 4. Chief Complaint, to include symptoms and degree of distress
- 5. History of present illness/injury

- 6. Pertinent Medical History:
  - Allergies
  - Medications
  - Past History of Current Illness
  - Last Meal
  - Events surrounding incident
- 7. Clinical condition:
  - Focused and detailed patient assessment findings
- 8. Treatment initiated and Response

### **Protocol 22**

# ADULT HEMORRHAGIC SHOCK

#### NOTE TO PREHOSPITAL PROVIDERS:

Consider pelvic binding for patients with suspected pelvic fracture and unstable vital signs.

For a pediatric patient refer to PEDIATRIC SHOCK PROTOCOL #68 🔶

#### NOTE TO PREHOSPITAL PROVIDERS:

**SPINAL MOTION RESTRICTION** includes placement of cervical collar and securing patient supine on stretcher. Long board use should be reserved for **patients in whom a reliable exam cannot be obtained**, multiple long bone fractures, or other injury in which transportation would be difficult or delayed without use of long board.

Revised: 03/01/22 Effective: 05/01/98

# **Protocol 24**

# **HEAD TRAUMA/UNCONSCIOUS PATIENT**

#### NOTE TO PREHOSPITAL PROVIDERS:

\*Do not delay transport time with multiple intubation attempts

\*\*For signs of increased ICP such as unequal or fixed pupils, posturing, Cushing's response (hypertension/bradycardia), abnormal respiratory pattern, ventilate to goal ETCO2 of 30-40 or if not available, 20 breaths per minute.

For a pediatric patient refer to PEDIATRIC HEAD TRAUMA ADDENDUM PROTOCOL #35a 🔶

Revised: 03/01/22 Effective: 05/01/98

### **Protocol 25**

# TRAUMATIC CARDIOPULMONARY ARREST

#### NOTE TO PREHOSPITAL PROVIDERS:

1. If IV/IO attempt is unsuccessful, refer to **APPROPRIATE DYSRHYTHMIA PROTOCOL. Reminder: Defibrillation does not require an IV.** 

2. Consider bilateral chest decompression in Blunt Trauma.

### **Protocol 26**

# ACCELERATED TRANSPORT "CODE 26"

Certain situations require treatment within minutes.

These situations occur when a problem is discovered in the primary survey that cannot be rapidly resolved by field intervention.

Only airway and cervical spinal immobilization should be managed prior to transport.

Further efforts at stabilization should be performed enroute and should not delay transport.

If circumstances demand hospital care for patient stability, rapid transport is indicated.

Each case will be unique and compelling reasons must be documented.

Notify the receiving hospital of the situation so that preparations can be made.

Primary resuscitative measures must be initiated.

Establish contact with Medical Control as soon as possible.

# Protocol 27

# ADULT ISOLATED EXTREMITY INJURY AND/OR AMPUTATED AND AVULSED PARTS

#### Ρ MORPHINE SULFATE (if available) in 2mg increments IV/IO/IM May repeat every 5 minutes as needed until improvement. Max total dose 10mg

#### AND/OR

OR

#### NITROUS OXIDE (if available)

Monitor and Reassess every 5 minutes following narcotic dose. Hold further doses of opioids if any respiratory depression or AMS. Apply capnography if available.

Revised: 03/01/22 Effective: 05/01/98

Ρ

В

L

# **Protocol 28**

# ADULT CRUSH INJURY

Suspected in extended entrapment of extremity and/or torso

Check for:

Pain – Paresthesia – Paralysis – Pallor – Pulselessness

Not needed but good indicators

Ρ

### **Protocol 29**

# ADULT SUSPENSION TRAUMA

Suspension trauma is a term used to describe the condition where a person is trapped in an upright position while using a safety harness for fall protection.

Revised: 03/01/22 Effective: 05/01/98 TRAUMA

Protocol 30 ADULT BURNS

Burn patients are often victims of multiple trauma. Treatment of major traumatic injuries takes precedence over wound management. Isolated burn injury patients should be transferred to the closest available hospital

#### ASSESS

•Total body surface area: use rule of 9s or estimate using patient's palmar surface as 1% •Depth of burn: partial or full thickness, consider exposure to products of combustion and treat as soon as possible.

В	EMT	В
Ι	EMT-I	I
Ρ	Paramedic	Ρ

ROUTINE TRAUMA CARE

Injury caused by multiple modalities: Burn, Blunt Penetrating Trauma, Barotrauma, Toxic Exposure

- Identify Nature of Device: Agent/Amount. Industrial Explosion. Improvised Device. Terrorist Incident.
- Identify Method of Delivery: Incendiary, Explosive
- Nature of Environment: Open/Closed

Treat Burns per ADULT BURNS PROTOCOL #30 🔷

Treat Crush Injury per ADULT CRUSH INJURY PROTOCOL #28 🔶

Treat Head Injury per HEAD TRAUMA/UNCONSCIOUS PATIENT PROTOCOL #24 🔶

Treat Hazardous Material Exposures per HAZARDOUS MATERIALS-GENERAL PROTOCOL #48

If signs or symptoms of tension pneumothorax **Needle Decompression** per **DECOMPRESSION OF TENSION PNEUMOTHORAX PROTOCOL #83** 

#### NOTE TO PREHOSPITAL PROVIDERS:

Note about Blast Lung Injury: Respiratory difficulty and Hypoxia more likely in enclosed space or in close proximity to explosion. Be careful with fluid administration. Avoid hyperventilation.

# PEDIATRIC TRAUMA

## Routine Trauma Care

BEMTBIEMT-IIPParamedicP

Ρ

- 1. Circulation
  - 1. Note variation of normal values
  - 2. IV access more difficult
    - Antecubital fossa ideal
    - May attempt external jugular
    - Intraosseous access if patient unconscious and not able to begin peripheral line
    - Do not delay transport to start IV
  - 3. Shock resuscitation **NS bolus at 20ml/kg until BP appropriate for age.** May repeat up to a max of 60ml/kg or 1000ml **NS**.
- 2. Airway
  - Keep suction available
  - Cervical spine immobilization
- 3. Breathing
  - 1. Note changes in ventilation rates by age
  - 2. 100% **OXYGEN**
  - 3. Assist ventilations as needed

(Refer to MEDICATION ASSISTED INTUBATION PROTOCOL #84  $\diamondsuit$  as indicated.)

#### Treatment of Suspected Battered or Abused Child: (Refer to SUSPECTED CHILD ABUSE AND NEGLECT PROTOCOL #76)

- 1. Treat obvious injuries
- 2. If parents refuse to let you transport the child after treatment:
  - 1. Remain at the scene
  - 2. Call for police assistance
  - 3. Request that the officer place the child under protective custody
  - 4. Assist with transport
- You are required by law to report your suspicions to the Department of Children and Family Services (DCFS). Also, document and report your suspicions to the ED physician and/or charge nurse.
- 4. Carefully document history, physical findings and environmental surroundings on patient care report.

## **Protocol 37**

## PEDIATRIC ASSESSMENT AND TRAUMA SCORE

#### Indicators of hypoperfusion:

•Respiratory difficulty

- •Cyanosis despite oxygen administration
- •Truncal pallor/cyanosis and coolness
- •Hypotension (ominous sign)
- •Bradycardia (late sign)
- •Weak, thready, or absent peripheral pulses
- •Decreasing consciousness
- •No palpable blood pressure

В	EMT	В
Ι	EMT-I	Ι
Ρ	Paramedic	Ρ

Pediatric Vital Signs						
Newborn 1 year 3 years 6 years 10 years 15 year					15 years	
Pulse	100-160	90-120	80-120	70-110	60-90	60-90
Respirations	30-60	20-30	20-30	18-25	15-20	15-18
Systolic BP	50-90	80-100	80-110	80-110	90-120	100-130

Pediatric Trauma Score				
Component	+2	+1	-1	
Size	Child/adolescent > 20kg	Toddler 11-20kg	Infant <u>&lt;</u> 10kg	
Airway	Normal	Maintainable	Unmaintained or intubated	
Systolic BP	>90mmHg	50-90mmHg	<50mmHg	
CNS	Awake	Obtunded/Loss of Consciousness	Coma/Unresponsive	
Skeletal Injury	None	Closed Fracture	Open/Multiple Fractures	
Open Wounds	None	Minor	Major Penetrating	

Score range is from -6 to +12. If a proper sized blood pressure cuff is not available, blood pressure can be rated as: +2 = palpable at wrist, +1 = palpable at groin, -1 = no pulse palpable

## PEDIATRIC BURNS: THERMAL, ELECTRICAL, CHEMICAL

## **Protocol 39**

## ADULT ACUTE ASTHMA/COPD WITH WHEEZING

M AT DISCRETION OF MEDICAL CONTROL: MAGNESIUM SULFATE (if available) 2g IVPB mixed with 250ml NS bag over 20 minutes

#### NOTE TO PREHOSPITAL PROVIDERS:

1. \*OXYGEN at 2 - 6L/min. If severe respiratory distress or cyanosis, 15L NRB

2. IV optional unless patient is in severe respiratory distress or pending failure.

3. If intubation required, may give ALBUTEROL (Ventolin) and IPRATROPIUM (Atrovent) in-line via ET tube.

4. For prolonged geographical transport, consider METHYLPREDNISOLONE (Solu-Medrol) 125mg IV.

For a pediatric patient refer to PEDIATRIC RESPIRATORY DISTRESS PROTOCOL #66

## **Protocol 40**

# ADULT COLD EMERGENCIES

#### AT DISCRETION OF MEDICAL CONTROL:

Refer to ADULT PAIN CONTROL PROTOCOL #5 Consider FENTANYL 50mcg IV/IO/IM/IN May repeat every 5 minutes as needed until improvement. Max total dose 200mcg OR MORPHINE SUI FATE (if available) in 5mg increments IV/IO/IM May repeat every 5 minutes as needed until

M MORPHINE SULFATE (if available) in 5mg increments IV/IO/IM May repeat every 5 minutes as needed until improvement. Max total dose 10mg.

Do not administer until shock has been controlled.

AND/OR NITROUS OXIDE Inhalation (if available)

Monitor and Reassess every 5 minutes following narcotic dose. Hold further doses of opioids if any respiratory depression or AMS. Apply capnography if available.

#### NOTE TO PREHOSPITAL PROVIDERS:

Assess pulse for 30-45 seconds before beginning CPR.

#### DO NOT GIVE ANY DRUGS!

May attempt defibrillation X 1 at maximum setting

For a pediatric patient refer to PEDIATRIC COLD EMERGENCIES PROTOCOL #74 🔶

Ρ

## **Protocol 47**

## ADULT SUSPECTED STROKE: PG 1 OF 2

- > Perform Cincinnati Prehospital Stroke Scale\*
- > Perform Rapid Arterial Occlusion Evaluation (RACE) Scale for Large Vessel Occlusion\*\*
- Identify patients last "known normal"
- > Identify if patient is on anticoagulants
- DOCUMENT ALL FINDINGS ABOVE

Do NOT unnecessarily delay transport for procedure. Scene time should be < 10 minutes.

ADULT SEIZURES/STATUS EPILEPTICUS PROTOCOL #44 🔶

# \*Cincinnati Prehospital Stroke Scale Facial Droop (Have the patient show teeth or smile) Normal – Both sides of face move equally well Abnormal – One side of face does not move as well as the other side Arm Drift (Patient closes eyes and holds both arms straight out with palms up for 10 seconds) Normal – Both arms move the same or both arms do not move at all (other findings, such as pronator drift, may be helpful) Abnormal – One arm does not move or one arm drifts down compared with the other Speech (Have the patient say, "You can't teach an old dog new tricks.") Normal – Patient uses correct words with no slurring Abnormal – Patient slurs words, uses inappropriate words, or is unable to speak

## **Protocol 47**

## **Protocol 54**

# ADULT DROWNING

#### NOTE TO PREHOSPITAL PROVIDERS:

After 90 minutes of documented submersion time, the receiving hospital should be contacted for concurrence of no resuscitative efforts on recovery of the patient.

The Dive Team will at this time go from rescue to recovery mode.

For a pediatric patient refer to **PEDIATRIC DROWNING PROTOCOL #75** 

## **Protocol 55**

## EMERGENCY CHILDBIRTH LABOR AND DELIVERY

## **Protocol 56**

## **OBSTETRICAL COMPLICATIONS**

## THIRD TRIMESTER BLEEDING - 6-9 MONTHS (Placenta Previa, Abruptio Placenta, Trauma)

#### AT DISCRETION OF MEDICAL CONTROL:

Μ

For prolonged geographical transport, consider **MAGNESIUM SULFATE** (if available) 4g IVPB mixed with 250ml NS bag over 20 minutes

## **Protocol 57**

## **ABNORMAL DELIVERIES**

- 1. Accelerated transport indicated with care enroute.
- 2. NEVER ATTEMPT TO PULL THE BABY FROM THE VAGINA BY THE LEGS OR TRUNK.
- 3. As soon as legs are delivered, support baby's body, wrapped in towel.
- 4. After shoulders are delivered, gently elevate trunk and legs to aid in delivery of head (if face down).
- 5. Head should deliver in 30 seconds. IF NOT, reach two gloved fingers into the vagina to locate infant's mouth.
- 6. Press vaginal wall away from baby's mouth to form an airway and apply gentle pressure to mother's mid upper abdomen.
- 7. Maintain this position until delivery or arrival at the hospital.

# **RESUSCITATION AND CARE OF THE NEWBORN**

## PEDIATRIC

## **Protocol 60**

# **PEDIATRIC INITIAL ASSESSMENT: PG 1 OF 3**

#### 1. SCENE SIZE UP

- Identify possible hazards.
- Assure safety for patient and responder.
- Observe for mechanism of injury/nature of illness.
- Note anything suspicious at the scene, i.e., medications, household chemicals, other ill family members.
- Assess any discrepancies between the history and the patient presentation, i.e. infant fell on hardwood floor however floor is carpeted.
- Initiate appropriate body substance isolation (BSI) precautions
- Determination of number of patients.

#### 2. GENERAL APPROACH TO THE STABLE/CONSCIOUS PEDIATRIC PATIENT

Assessments and interventions must be tailored to each child in terms of age, size and development.

- Smile if appropriate to the situation.
- Keep voice at even quiet tone, don't yell.
- Speak slowly, use simple, age appropriate terms.
- Use toys or penlight as distracters; make a game of assessment.
- Keep small children with their caregiver(s);
- Kneel down to the level of the child if possible.
- Be cautious in use of touch. In the stable child, make as many observations as possible before touching (and potentially upsetting) the child.
- Adolescents may need to be interviewed without their caregivers present if accurate information is to be obtained regarding drug use, alcohol use, last menstrual period, sexual activity, child abuse.

While walking up to the patient, observe/inspect the following:

- General appearance, age appropriate behavior.
- Malnourished appearance? Is child looking around, responding with curiosity or fear, playing, sucking on a pacifier or bottle, quiet, eyes open but not moving much or uninterested in environment?
- Obvious respiratory distress or extreme pain.
- Position of the child. Are the head, neck or arms being held in a position suggestive of spinal injury? Is the patient sitting up or in tripod position?
- Level of consciousness, i.e., awake vs asleep or unresponsive.
- Muscle tone: good vs limp.
- Movement: spontaneous, purposeful, symmetrical.
- Color: pink, pale, flushed, cyanotic, mottled.
- · Obvious injuries, bleeding, bruising, impaled objects or gross deformities.
- Determine weight Use length/weight tape to determine kilos for medication administration.
- A length/weight based tape will be utilized to determine medication dosing.

#### 3. INITIAL ASSESSMENT

#### Circulation

- Heart rate compare to normal rate for age and situation.
- Central/truncal pulses (brachial, femoral, carotid) strong, weak or absent.
- Distal/peripheral pulses present/absent, thready, weak, strong.
- Color pink, pale, flushed cyanotic, mottled.
- Skin temperature hot, warm, cool.
- Blood pressure compare to normal for age of child. Must use appropriate sized cuff.
- Hydration anterior fontanel in infants, mucous membranes, skin turgor, crying tears, urine output history. Revised: 03/01/22

### PEDIATRIC

## **Protocol 60**

# PEDIATRIC INITIAL ASSESSMENT: PG 2 OF 3

Airway Access/Maintenance with Cervical Spine Control

- Maintainable with assistance: positioning.
- Maintainable with adjuncts: oral airway, nasal airway.
- Maintainable with endotracheal tube.
- Listen for any audible airway noises, i.e., stridor, snoring, gurgling, wheezing.
- Patency: suction secretions as necessary.

#### Breathing

- Rate and rhythm of respirations. Compare to normal rate for age and situation.
- Chest expansion symmetrical.
- Breath sounds compare both sides and listen for sounds (present, absent, normal, abnormal).
- Positioning sniffing position, tripod positions.
- · Work of breathing retractions, nasal flaring, accessory muscle use, head bobbing, grunting.

#### **Disability - Brief Neuro Examination**

- Assess Responsiveness
  - A Alert
  - V Responds to verbal stimuli
  - P Responds to pressure
  - U Unresponsive
- Assess pupils
- Assess for transient numbness/tingling.

#### Expose and Examine

- Expose the patient as appropriate based on age and severity of illness.
- · Initiate measures to prevent heat loss and keep the child from becoming hypothermic.

#### 4. FOCUSED HISTORY/PHYSICAL ASSESSMENT

Tailor assessment to the needs of the patient. Rapidly examine areas specific to the chief complaint.

- Signs & Symptoms as they relate to the chief complaint.
- · Allergies to medications, foods, environmental
- Medications: prescribed, over-the-counter, compliance with prescribed dosing regimen, time, date and amount of last dose
- Past Pertinent Medical History
  - > Pertinent medical or surgical problems
  - Preexisting diseases/chronic illness
  - Previous hospitalizations
  - > Currently under medical care
  - For infants, obtain a neonatal history (gestation, prematurity, congenital anomalies, was infant discharged home at the same time as the mother)
- Last oral intake of liquid/food ingested.
- Events surrounding current problem
  - > Onset, duration and precipitating factors
  - > Associated factors such as toxic inhalants, drugs, alcohol
  - Injury scenario and mechanism of injury
  - Treatment given by caregiver

#### **Responsive Medical Patients**

Perform rapid assessment based on chief complaint. A full review of systems may not be necessary. If chief complaint is vague, examine all systems.

В	EMT	В
Ι	EMT-I	Ι
Ρ	Paramedic	Ρ

#### PEDIATRIC

## **Protocol 60**

# PEDIATRIC INITIAL ASSESSMENT: PG 3 OF 3

Unresponsive Medical Patients

- Perform rapid assessment: CABs, quick head-to-toe exam.
- Emergency care based on signs and symptoms, initial impressions and standard operating procedures.

Trauma patient with NO significant mechanism of injury.

• Focused assessment is based on patient complaint.

Trauma patient WITH significant mechanism of injury.

• Perform rapid assessment of all body systems.

#### 5. DETAILED ASSESSMENT

Performed to detect non-life-threatening conditions and to provide care for those conditions/injuries. Usually performed enroute. May be performed on scene if transport is delayed.

- Inspect and palpate each of the major body systems for the following:
- Deformities
- Contusions
- Abrasions
- Penetrations/punctures
- Burns
- Tenderness
- Lacerations
- Swelling/edema
- Instability
- Crepitus
- Auscultation of breath and heart sounds as well as blood pressure readings may be required in the field.

#### 6. ONGOING ASSESSMENT

To effectively maintain awareness of changes in patient's condition, repeated assessments are essential and should be performed at least every 5 minutes on the unstable patient, and at least every 15 minutes on the stable patient.

- 7. CONSIDERATIONS FOR CHILDREN WITH SPECIAL HEALTHCARE NEEDS (CSHN)
  - Be familiar with CSHN in your service community and with both the child as well as their anticipated emergency care needs.
  - Refer to child's emergency care plan formulated by their medical providers, (if available). Understanding the child's baseline will assist in determining the significance of altered physical findings. Parents/caregivers are the best source of information on: medications, baseline vitals, functional level/normal mentation, likely medical complications, equipment operation and troubleshooting, emergency procedures.
  - Regardless of underlying condition, assess in a systematic and thorough manner. Use parents/caregivers/home health nurses as medical resources.
  - Be prepared for differences in airway anatomy, physical development, cognitive development and possibly
    existing surgical alterations or mechanical adjuncts. Common home therapies include: respiratory support
    (oxygen, apnea monitors, pulse oximeters, tracheostomies, mechanical ventilators), nutrition therapy
    (nasogastric or gastrostomy feeding tubes), intravenous therapy (central venous catheters), urinary
    catheterization or dialysis (continuous ambulatory peritoneal dialysis), biotelemetry, ostomy care, orthotic
    devices, communication or mobility devices, or hospice care.
  - Communicate with the child in an age appropriate manner. Maintain communication with and remain sensitive to the parents/caregivers and the child.
  - The most common emergency encountered with these patients is respiratory related and so familiarity with respiratory emergency interventions/adjuncts/treatment is appropriate.

# PEDIATRIC DROWNING

### **Protocol 76**

# SUSPECTED CHILD ABUSE AND NEGLECT PAGE 1 OF 2

### **Protocol 76**

# SUSPECTED CHILD ABUSE AND NEGLECT PAGE 2 OF 2

#### NOTE TO PREHOSPITAL PERSONNEL:

- 1. You are required by law to report your suspicions.
- 2. Suspect battered or abused child if any of the following is found:
  - A discrepancy exists between history of injury and physical exam.
  - Caregiver provides a changing or inconsistent history.
  - There is a prolonged interval between injury and the seeking of medical help.
  - Child has a history of repeated trauma.
  - Caregiver responds inappropriately or does not comply with medical advice.
  - Suspicious injuries are present, such as:
    - > Injuries of soft tissue areas, including the face, neck and abdomen
    - > Injuries of body areas that are normally shielded, including the back and chest
    - > Fractures of long bones in children under 3 years of age
    - > Old scars, or injuries in different stages of healing
    - > Bizarre injuries, such as bites, cigarette burns, rope marks, imprint of belt or other object
    - > Trauma of genital or perianal areas
    - > Sharply demarcated burns in unusual areas
    - > Scalds that suggest child was dipped into hot water
- 3. The following are some common forms of neglect:
  - Environment is dangerous to the child (e.g. weapons within reach, playing near open windows without screen/guards, perilously unsanitary conditions, etc.).
  - Caretaker has not provided, or refuses to permit medical treatment of child's acute or chronic life-threatening illness, or of chronic illness, or fails to seek necessary and timely medical care for child.
  - Abandonment
  - Caretaker appears to be incapacitated (e.g. extreme drug/alcohol intoxication, disabling psychiatric symptoms, prostrating illness) and cannot meet child's care requirements.
  - Child appears inadequately fed (e.g. seriously underweight, emaciated, or dehydrated) inadequately clothed, or inadequately sheltered.
  - Child is found to be intoxicated or under the influence of an illicit substance(s).

### **Protocol 77**

# DOMESTIC VIOLENCE, SPOUSAL ABUSE, GERIATRIC ABUSE, AND SEXUAL ASSAULT PAGE 1 OF 2

#### 1. PURPOSE/DEFINITION

Given the magnitude of the problems of abuse and violence in our society, early detection of domestic violence victims, appropriate legal and social service referrals and the delivery of timely medical care are essential. Domestic violence is a pattern of coercive behavior engaged in by someone who is or who was in an intimate or family relationship with the recipient. These behaviors may include: repeated battering, psychological abuse, sexual assault or social isolation such as restricted access to money, friends, transportation, health care or employment. Typically, the victims are female, but it must be recognized that males can be victims of abuses as well.

#### 2. DOMESTIC VIOLENCE INDICATORS

While sometimes the specific history of abuse is offered, many times the victim of abuse, (either out of fear or because of the coercive nature of the relationship or out of desire to protect the abuser) will not volunteer a true history but instead ascribe injuries to another cause. Therefore, an appropriate review must be undertaken with respect to patients presenting with injuries:

- That do not seem to correspond with the explanation offered.
- That are of varying ages.
- That have the contour of objects commonly used to inflict injury (hand, belt, rope, chain, teeth, cigarette).
- During pregnancy.

Other factors include:

- · Partner accompanies patient and answers all questions directed to patient.
- Patient reluctant to speak in front of partner.
- · Denial or minimalization of injury by partner or patient.
- Intensive, irrational jealousy or possessiveness expressed by partner.

Physical injuries commonly associated with domestic violence:

- Central injuries, specifically to the face, head, neck, chest, breasts, abdomen, or genital areas.
- Contusions, lacerations, abrasions, stab wounds, burns, human bites, fractures (particularly of the nose and orbits) and spiral wrist fractures
- · Complaints of acute or chronic pain without tissue injury
- · Signs of sexual assault
- · Injuries of vaginal bleeding during pregnancy, spontaneous or threatened miscarriage
- Direct impact of domestic violence on pregnancy may include:
  - > Abdominal trauma leading to abruption, pre-term labor, and delivery
  - Fetal fracture
  - Ruptured maternal liver, spleen, uterus
  - > Antepartum hemorrhage
  - Exacerbation of chronic illness
- · Multiple injuries in different stages of healing

### **Protocol 77**

# DOMESTIC VIOLENCE, SPOUSAL ABUSE, GERIATRIC ABUSE, AND SEXUAL ASSAULT PAGE 2 OF 2

#### 3. APPROACHES FOR INTERVIEWING THE PATIENT

The goals of the physical examination are to identify injuries requiring further medical intervention and to make observations and collect evidence that may corroborate the patient's report of abuse. A thorough physical examination is essential to uncover hidden injuries or compensated trauma. If the patient reports sexual assault, the **DOMESTIC VIOLENCE/SPOUSAL ABUSE/GERIATRIC ABUSE/SEXUAL ASSAULT PROTOCOL #77** should be followed:

- Always interview the patient in a private place, away from anyone accompanying them to the ED. Questioning the patient in front of the batterer may place the patient and any children in danger.
- You may be the first person or professional to acknowledge the abuse. It is important that you convey your concerns about what has happened to the patient to the Emergency Physician and Nurse.
- When interviewing, do not ask the patients if they were battered or abused (many battered persons do not consider themselves in this light). Instead you can ask the patient:
  - "Have you had a fight with someone?"
  - "Did anyone hurt you?"
  - "Many times we have seen these types of injuries in patients who are hurt by someone else, did someone hurt you?"
  - > "I am concerned that someone may be hurting you or scaring you, can you tell me what happened?"
- Most battered persons feel very shamed and humiliated about what has happened to them. It is important to acknowledge that you understand how difficult it is to talk about what has happened.
- Many battered persons will minimize the abuse or blame themselves for what happened. It is important that you repeatedly reinforce that no one deserves to be hurt no matter what they may or may not have done.
- Questions/attitude <u>Not</u> to Ask/Express:
  - > What keeps you with a person like that?
  - > Do you get something out of the violence?
  - > What did you do at the moment that caused them to hit you?
  - > What could you have done to avoid or defuse the situation?

#### 4. PRACTICE

- Treat obvious injuries; transport.
- Report your suspicion and supporting findings to the Emergency Department Physician and on the prehospital report form.
- Document the name of the physician and/or nurse to whom you reported your suspicion on the prehospital report form.
- · If the patient refuses transport, make appropriate referral and document on run sheet.
- Document your findings on the prehospital report form:
- > Presenting condition
- > Any suspicious indicators
- > Any suspicious commentary made by the patient on interviewing the patient.
- > Physical exam including any evidence of abuse.
- Treatment rendered

Report Suspicions of Geriatric (Elder) Abuse or Neglect to ED physician, ED charge nurse <u>AND</u> the 24-hour Adult Protective Services Hotline 1-866-800-1409

### **Protocol 78**

# TRIPLE ZERO / DNR / CRITERIA FOR INITIATION OF CPR

Personnel, whether operating at a Basic, Intermediate, or Advance Life Support levels, are required to immediately initiate CPR whenever clinical signs of death exist.

THERE ARE ONLY TWO (2) EXCEPTIONS TO THIS REQUIREMENT:

1. Triple Zero: Signs of Explicit Biological Death Exists

The use of the term "Triple Zero" helps to alleviate the possibility of hysteria from family and/or bystanders due to any radio communications they may overhear and clearly alerts the hospital telemetry personnel to the likelihood of the patient arriving DOA.

- A. The field unit will notify the hospital over telemetry, "We have a TRIPLE ZERO." This indicates that they have a patient who is pulseless, non-breathing, and exhibits one or more of the following long-term indications of death:
  - · Profound dependent lividity
  - Rigor mortis without profound hypothermia
  - · Patient who has suffered decapitation
  - Skin deterioration or decomposition
  - Mummification or dehydration, especially in infants
  - Putrefaction
- B. Transmit a rhythm strip via telemetry, as requested.

- C. The hospital will confirm the Triple Zero and will give orders to transport providing it is not a county medical examiner's case.
- D. The confirmation of a Triple Zero is not to be construed as a pronouncement of death.
- E. Transport of Triple Zero Situations may arise where prolonged delays resulting from dispensations of obviously dead patients would tie up an ALS vehicle for unreasonable lengths of time. If the paramedics encounter a patient whom they confirm to be a Triple Zero over telemetry, they may transfer responsibility for transportation of that patient to another ambulance service, either BLS, ILS or ALS, the appropriate police department, or an agency who is reasonably appropriate for the circumstance, who may transport the patient to a hospital to have death pronounced by an individual legally authorized to do so.
- 2. DNR (Do Not Resuscitate) See System Policy
- Except in the conditions listed above, CPR is to be initiated immediately and continued until one (1) of the following occurs:
  - 1. Effective spontaneous circulation and ventilation have been restored.
  - 2. Resuscitation efforts have been transferred to other persons of at least equal skill, training and experience.
  - 3. The rescuers are exhausted and physically unable to continue resuscitation.
  - 4. A direct order from an on-line Medical Control Physician is given to discontinue CPR.
- A system hospital is to be contacted over telemetry in ALL cases of cardiac arrest, whether or not the patient has signs of clinical death, meets the criteria for Triple Zero (Biological Death) or has a "Do Not Resuscitate" order.

In cases where the patient's status is unclear and the appropriateness of CONTINUED CPR is questioned, paramedics should call the appropriate system hospital AFTER initiation of CPR.

# **Protocol 79**

### ADULT RESTRAINTS AND BEHAVIORAL EMERGENCIES

**Maintain situational awareness and scene safety.** Introduce yourself to the patient, and attempt to gain their confidence in a non-threatening manner. If the patient refuses assistance, attempt to determine their mental status. This includes determining their orientation and the presence of anything that could produce an altered mental status, such as drug/alcohol intoxication or withdrawal, trauma (head injury), hypoxia, hypotension, hypoglycemia, stroke, infections, psychological emergencies (i.e. homicidal, suicidal, psychosis, etc.) or dementia (i.e. acute or chronic organic brain syndromes).

- 1. Again attempt to verbally reassure the patient and seek their willing cooperation.
- 2. If it is necessary to physically restrain a patient, perform all the following:
  - A. Prepare all the necessary equipment.
  - B. Use police and/or fire personnel if needed. Have one person assigned to each extremity and one to equipment (if available).
  - C. Apply the restraints as loosely as possible to maintain a safe situation, but prevent neurovascular compromise and undue patient discomfort. Apply restraints over clothing when possible.
  - D. Never place restraints over a patient's chest or on the abdomen of a pregnant patient.
  - E. Perform routine and specific medical care as indicated by the patient's condition. Routinely document the neurovascular status of the patient's extremities distal to the restraints.
  - F. Notify the receiving hospital of the situation, and request security assistance upon arrival.
  - G. Continue to attempt to verbally reassure the patient and seek their cooperation. Inform the patient's family of the reasons for the use of restraints.
  - H. Thoroughly document the situation including the reasons for using restraints and how they were applied.
  - I. Only approved spit barrier devices may be used.
  - J. Never restrain a patient in the prone position.
  - K. For reasons of medical safety, any patient who is under police hold and requires handcuffs, must have a police officer accompany the patient in the back of the ambulance while enroute to the hospital or provide the transporting EMS personnel with keys to the handcuffs.

#### AT DISCRETION OF MEDICAL CONTROL:

M For the patient exhibiting Excited Delirium, may consider **KETAMINE (if available) 2mg/kg IM** Monitor via pulse oximetry and capnography (if available).

#### NOTE TO PREHOSPITAL PROVIDERS:

Once restrained, continue to be conscious of the patient's airway and other medical needs.

6. All personnel who witness the event should sign the prehospital patient care report.

### Contact Medical Control Physician with any questions.

### **Protocol 81**

## NITROUS OXIDE ADMINISTRATION

INDICATIONS FOR **NITROUS OXIDE** ANALGESIA INCLUDE:

- Severe pain due to musculoskeletal trauma
- Non-respiratory burns
- Kidney stones
- NITROUS OXIDE is to be administered as a fixed 50/50 concentration with OXYGEN only.
- The monitoring of the patient's oxygen saturation via pulse oximetry is mandatory.
- The delivery device utilized must be fixed and not adjustable.
- NITROUS OXIDE must be self administered by the patient.
- There must be NO contraindications to the use of NITROUS OXIDE.

#### **CONTRAINDICATIONS INCLUDE:**

- > Altered mental status that would make the patient unable to self administer
- Shock

Ρ

- Severe maxillofacial injuries
- Chronic Obstructive Pulmonary Disease
- Abdominal trauma
- > Distended abdomen / possible bowel obstruction
- Head injury
- Pregnancy
- Fire hazard situations
- > Any other situation in which the patient cannot self administer NITROUS OXIDE

### **Protocol 82**

### EXTERNAL JUGULAR VEIN CANNULATION

- Position patient in Trendelenburg position.
- Turn the head away from the side to be cannulated.
- Prep the skin with cleansing prep.

Ρ

- Apply traction to the skin just above the clavicle.
- Insert the catheter, "bevel up," at a 30-degree angle, directed toward the shoulder on the same side. The needle should enter midway between the angle of the mandible and the clavicle. There will be a flash of blood as you enter the vein.
- Carefully lower the needle and catheter and advance them about 2mm further into the vein.
- Advance the catheter over the needle into the vein and remove the needle.
- Discard the needle in a sharps container do not recap the needle.
- Attach IV tubing to the hub of the catheter and open the flow regulator to assure fluid flows freely.
- Secure the catheter to the skin.

### **Protocol 83**

### **DECOMPRESSION OF TENSION PNEUMOTHORAX**

- Assure the patient is receiving high-flow oxygen.
- Identify the side of the chest needing decompression (this is the side with decreased breath sounds.)
- Prep the site (second intercostal space in the midclavicular line or 4th intercostal space mid axillary line) with a cleansing prep.
- Introduce the needle into the 2<sup>nd</sup> intercostal space, directing it perpendicularly over the superior aspect of the 3rd rib or 4th intercostal space mid axillary line.
- Insert the needle until a rush of air exits.
- Remove the needle, leaving the catheter in place.
- · Secure the catheter to the chest wall.
- Reassess breath sounds.

#### NOTE TO PREHOSPITAL PROVIDERS:

For pediatric patients, preferred site is second intercostal space in the mid-clavicular line. For adults, use 14 gauge needle at least 1.5 inches in length.

### **Protocol 84**

# **MEDICATION ASSISTED INTUBATION**

- Indications that may require Medication Assisted Intubation:
  - Glasgow Coma Score <8</p>
  - Imminent respiratory arrest
  - Imminent tracheal/laryngeal closure due to severe edema secondary to trauma or an allergic process

L

- Severe flail chest and/or severe open chest wounds with cyanosis and a respiratory rate >30 or <10</p>
- Initial Medical Care

Ρ

- Always have supraglottic airway device and/or needle cricothyrotomy equipment available.
- Prepare patient and equipment.
- Monitor via pulse oximetry and capnography (if available).

		7			
	Adults	Pediatrics			
	Continue to assist ventilations during the procedure	Continue to assist ventilations during the procedure

Ρ	Paramedic	Ρ

### **Protocol 86**

### NEEDLE CRICOTHYROTOMY

- Attempt to ventilate the patient with BVM.
- Attach an empty syringe to a large gauge angiocath.
- Locate the thyroid notch, the cricothyroid notch, and the cricoid cartilage.
- Cleanse area with cleansing prep.

I

- Grasp the thyroid cartilage firmly in the nondominant hand.
- While aspirating, puncture the cricoid membrane with the angiocath, directing it caudally, at a 45-degree angle. (The plunger of the syringe will move freely when the needle has entered the trachea.)
- Remove the needle from the catheter and advance the catheter into the trachea.
- Reattach the syringe to the catheter and aspirate again to insure correct placement.
- Attach the plastic adapter from a #3 ET tube to the catheter.
- Attach ambu bag to the adapter and ventilate the patient.
- Ventilate with 2-3 seconds of inspiration followed by passive exhalation.
- Auscultate bilateral axillae and epigastrium.

### **Protocol 87**

# TRANSCUTANEOUS CARDIAC PACING

P Paramedic P

- 1. Place pacing electrodes
  - A. Anterior/Posterior Electrode Placement
    - Place negative electrode on left anterior chest, halfway between the xiphoid process and the left nipple, with upper edge of the electrode below the nipple line.
    - Place positive electrode on the left posterior chest beneath the scapula and lateral to the spine.
    - NOTE: If Anterior/posterior position is contraindicated, anterior/anterior position may be used.
  - B. Anterior/Anterior Electrode Placement
    - Place negative electrode on left chest over the fourth intercostal space in the midaxillary line.
    - Place positive electrode on anterior right chest in the subclavicular area.
    - NOTE: Anterior/anterior position should only be used if anterior/posterior position cannot be used.
- 2. Apply pacing cables to pacing electrodes.
- 3. Activate "pacing" switch.
- 4. Adjust MA setting.
- 5. Select desired heart rate (usually 70 beats per minute).
- 6. Activate "start/stop" switch.
- 7. Observe monitor for capture and monitor patient response and pulse.
- 8. Slowly turn up the MA until evidence of electrical and mechanical capture occurs (usually 50-150 MA).
  - A. Mechanical capture is indicated by the presence of a palpable pulse.
  - B. Electrical capture is evidenced by a spike followed by a wide QRS complex and a broad T wave.
  - C. Skeletal muscle twitching does not indicate capture.
- 9. Conscious patients may require sedation and/or analgesia.

#### NOTE TO PREHOSPITAL PROVIDERS:

Ρ

If **MIDAZOLAM HYDROCHLORIDE (Versed)** is administered for sedation, monitor via pulse oximetry and capnography (if available)

Ρ

### **Protocol 88**

### CONCEALED CARRY / FIREARM

В	EMT	В
Ι	EMT-I	L
Ρ	Paramedic	Ρ

#### PATIENT CARE

All legal efforts should be utilized to avoid having to transport the weapon to the Emergency Department. However, if the patient's condition requires immediate transportation , then transportation should not be delayed unless there is an imminent life threat to the providers. If the patient is stable, and law enforcement is in route, transportation may be delayed to relinquish the weapon to the Police Officer.

#### SAFETY

Scene safety remains the top priority for EMS responders. If the EMS responders feel that there is a valid life threat to themselves, then retreat to a safe zone is indicated. Stage in a safe location to be able to re-enter the scene when secured by law enforcement.

When you must transport the weapon, it *must* be secured to prevent accidental discharge.

#### NOTIFICATION TO THE EMERGENCY DEPARTMENT

When transporting the weapon on the Ambulance, the provider will contact the Emergency Department early. The radio report needs to contain the verbiage *"I have a firearm on board"* to inform the emergency department that there is a secured weapon on the ambulance and will require someone from the hospital to take custody of the weapon upon arrival.

#### TRANSFERRING THE WEAPON AT THE HOSPITAL

Upon arrival, relinquish the weapon to the Hospital's designee as soon as possible. Do not leave the weapon unattended at any time.

# Appendix A page 1 of 2

# Appendix D

# ADULT AND PEDIATRIC DEXTROSE CHARTS

### ADULT DEXTROSE

Product	50% Dextrose (25gm/50mL)	10% Dextrose (25g/250mL or 50g/500mL or 100g/1000mL)
Administration Instructions	Administer 50mL IV/IO	<ul> <li>Infuse 100mL boluses up to a max of 500mL</li> <li>Reassess lung sounds and mental status after each 100ml bolus.</li> <li>If patient becomes more alert and blood glucose &gt;60, slow infusion rate to TKO</li> </ul>

### PEDIATRIC DEXTROSE

Product	25% Dextrose (2.5g/10mL)	12.5% Dextrose (2.5g/20mL)	10% Dextrose (25g/250mL)
	2ml/kg IV/IO	4ml/kg IV/IO	5ml/kg IV/IO
Administration Instructions	Dilution Instructions if needed: Dilute 50 % Dextrose 1:1 with sterile water or normal saline to make 25% Dextrose Max initial dose: 100ml (25g)	Dilution Instructions If needed: Dilute 25% Dextrose 1:1 with sterile water or normal saline to make 12.5% Dextrose Max initial dose: 200mL (25g)	Preferred for neonate<5kg Max initial dose: 250mL (25g)
